

# POLICIES AND VALUE FUNCTIONS

# PROBLEM FORMULATION

## OVERVIEW

An MDP describes the problem space.

- How the agent interacts with a world, i.e., state and action spaces
- How the world evolves, i.e., transition dynamics
- How the agent is evaluated, i.e., reward function,  $\gamma$

What is the space of solutions?

# PROBLEM FORMULATION

## OVERVIEW

An MDP describes the problem space.

- How the agent interacts with a world, i.e., state and action spaces
- How the world evolves, i.e., transition dynamics
- How the agent is evaluated, i.e., reward function,  $\gamma$

What is the space of solutions?

# PROBLEM FORMULATION

## SOLUTION SPACE

The search space of solutions for an MDP is the different ways an agent can select an action in each state.

We call the mechanism an agent uses to select actions a *policy*  $\pi$ .

$$\pi : \mathcal{S} \times \mathcal{A} \rightarrow [0,1]$$

Describes a conditional probability distribution over action in each state.

$$\pi(a | s) = \Pr(A_t = a | S_t = s)$$

# PROBLEM FORMULATION

## SOLUTION SPACE

A policy is, in general, stochastic  $\pi(a | s) = \Pr(A_t = a | S_t = s)$

Can be deterministic  $\pi(a | s) = 1.0, \forall a' \neq a, \pi(a' | s) = 0$

Special notation  $\pi: \mathcal{S} \rightarrow \mathcal{A}, a = \pi(s)$

# PROBLEM FORMULATION

## SOLUTION SPACE

A policy is, in general, stochastic  $\pi(a | s) = \Pr(A_t = a | S_t = s)$

Can be deterministic  $\pi(a | s) = 1.0, \forall a' \neq a, \pi(a' | s) = 0$

Special notation  $\pi: \mathcal{S} \rightarrow \mathcal{A}, a = \pi(s)$

# POLICIES AND TIME

## STATIONARY VS NONSTATIONARY

Let  $\pi_t$  be the policy the agent uses at time  $t$

A sequence of policies  $\pi_0, \pi_1, \dots, \pi_t, \dots$  is **stationary** if

$$\forall(a, s), \forall t, t' \Pr(A_t = a \mid S_t = s) = \Pr(A_{t'} = a \mid S_{t'} = s)$$

Otherwise, the sequence of policies is **nonstationary**

- The agent *will* change its policy as it learns
- It is challenging to reason about a changing policy

Instead, we will reason about how good one particular policy  $\pi$  is, assuming we won't change it

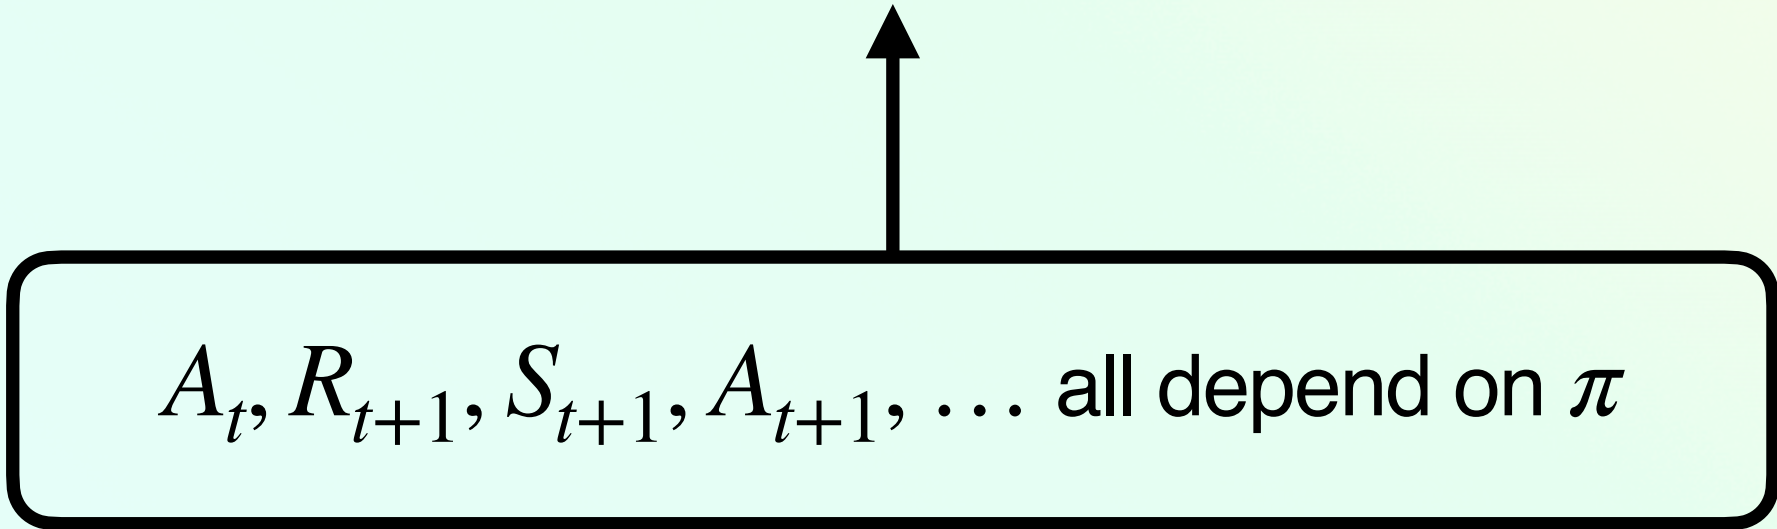

# HOW GOOD IS A POLICY

## VALUE FUNCTIONS

The value (quality) of a policy  $\pi$  in a state  $s$  is given by the *state value function*

$$v_{\pi}(s) \doteq \mathbb{E}[G_t | S_t = s]$$

$A_t, R_{t+1}, S_{t+1}, A_{t+1}, \dots$  all depend on  $\pi$

# RANDOM VARIABLES AND POLICIES

## DEFINING $A_t$

$A_t$  is the random variable for an action sampled from a policy  $\pi$

What if we use a policy  $\pi'$ ? Define a new random variable.

$A'_t$  is the random variable for an action sampled from a policy  $\pi'$

$\Pr(S_t = s), \Pr(R_t = r)$ ? All depend on  $A_t$

$S'_t, R'_t$  are the states and rewards observed after taking action  $A'_{t-1}$  in state  $S'_{t-1}$

$p'(s', r | s, a) \doteq \Pr(S'_t = s', R'_t = r | S'_{t-1} = s, A'_{t-1} = a)$

# RANDOM VARIABLES AND POLICIES

DEFINING  $A_t$

$$G'_t = \sum_{k=0}^{\infty} \gamma^k R'_{t+1+k}$$

$$v_{\pi'}(s) \doteq \mathbb{E}[G'_t | S'_t = s]$$

$\pi$  — represents a variable so we can represent specific policies with one notation

Let  $\pi_1$  and  $\pi_2$  be two specific policies.

$$v_{\pi_1}(s) = v_{\pi}(s) \text{ for } \pi = \pi_1 \text{ and } v_{\pi_2}(s) = v_{\pi}(s) \text{ for } \pi = \pi_2$$

$$v_{\pi_1}(s) - v_{\pi_2}(s) = \mathbb{E}[G_t^1 | S_t^1 = s] - \mathbb{E}[G_t^2 | S_t^2 = s]$$

need to consider different probabilities for each policy when comparing them

# RANDOM VARIABLES AND POLICIES

DEFINING  $A_t$

$v_\pi(s) \doteq \mathbb{E}[G_t | S_t = s]$  — book, and this class

$v_\pi(s) \doteq \mathbb{E}_\pi[G_t | S_t = s]$  — Coursera, and many papers

Explicit, but not necessary sense  $A_t$  is defined to come from  $\pi$

# HOW GOOD IS A POLICY

## VALUE FUNCTIONS

The value (quality) of a policy  $\pi$  in a state  $s$  is given by the *state value function*

$$v_{\pi}(s) \doteq \mathbb{E}[G_t | S_t = s]$$

The value of taking an action  $a$  in state  $s$  and then selecting actions according to  $\pi$  is given by the *action value function*

$$q_{\pi}(s, a) \doteq \mathbb{E}[G_t | S_t = s, A_t = a]$$

# HOW GOOD IS A POLICY

## VALUE FUNCTIONS

$v_\pi(s)$  says how good  $\pi$  is at making decisions in state  $s$  and the states that come after

$q_\pi(s, a)$  Use reason about how good one action is versus another when using  $\pi$

$$q_\pi(s, a_1) > q_\pi(s, a_2)?$$

$\arg \max_a q_\pi(s, a)$  — find best action(s) in the state and under the current policy

# HOW GOOD IS A POLICY

## VALUE FUNCTIONS

Express  $v_\pi$  in terms of  $q_\pi$

$$\begin{aligned} v_\pi(s) &= \mathbb{E}[G_t | S_t = s] \\ &= \sum_a \Pr(A_t = a | S_t = s) \mathbb{E}[G_t | S_t = s, A_t = a] \\ &= \sum_a \Pr(A_t = a | S_t = s) q_\pi(s, a) \\ &= \sum_a \pi(a | s) q_\pi(s, a) \end{aligned}$$

# EXAMPLE

## BANDIT

# EXAMPLE

## BANDIT

Let  $Q_n(1) = 3$ ,  $Q_n(2) = 2$ ,  $Q_n(3) = 1$  be the estimates of  $q_*(a)$

$$\pi_{\text{greedy}}(1 \mid s_0) = 1.0$$

$$\pi_{\epsilon\text{-greedy}}(1 \mid s_0) = (1 - \epsilon) + \epsilon/3 \quad \pi_{\epsilon\text{-greedy}}(2 \mid s_0) = \pi_{\epsilon\text{-greedy}}(3 \mid s_0) = \epsilon/3$$

# EXAMPLE

## BANDIT

For this problem  $G_0 = R_1 + \gamma 0 + \gamma^2 0 + \dots = R_1$ , thus  
 $q_\pi(s_0, a) = \mathbb{E}[R_1 + \gamma 0 + \dots \mid S_0 = s_0, A_0 = a] = \mathbb{E}[R_1 \mid S_0 = s_0, A_0 = a] = r(s_0, a) = q_*(a)$

$$v_{\pi_{\text{greedy}}}(s_0) = \sum_a \pi(a \mid s_0) q_{\pi_{\text{greedy}}}(s_0, a) = q_{\pi_{\text{greedy}}}(s_0, 1) = q_*(1)$$

$$v_{\pi_{\epsilon\text{-greedy}}}(s_0) = \sum_a \pi(a \mid s_0) q_{\pi_{\epsilon\text{-greedy}}}(s_0, a) = q_{\pi_{\epsilon\text{-greedy}}}(s_0, 1) = \begin{pmatrix} \left( (1 - \epsilon) + \frac{\epsilon}{3} \right) q_*(1) \\ + \frac{\epsilon}{3} q_*(2) \\ + \frac{\epsilon}{3} q_*(3) \end{pmatrix}$$

$v_{\pi_{\text{greedy}}}(s_0) > v_{\pi_{\epsilon\text{-greedy}}}(s_0)$  ask if  $\pi_{\text{greedy}}$  better than  $\pi_{\epsilon\text{-greedy}}$  in state  $s_0$

# EXAMPLE

## BANDIT - OPTIMAL POLICY

What policy (or policies) are optimal for this problem?

Let  $\mathcal{A}^* = \arg \max_a q_*(a)$

$\pi(s_0) \in \mathcal{A}^*$  any deterministic policy that chooses an action that maximizes  $q_*$

Or any policy such that  $\sum_{a \in \mathcal{A}^*} \pi(a | s_0) = 1$  only chooses optimal actions

# EXAMPLE

## BANDIT - OPTIMAL POLICY

At least one deterministic optimal policy

$n$  deterministic optimal policies if  $n$  optimal actions

Infinitely many optimal policies of  $n > 1$

$$\{a_1, a_2\} = \mathcal{A}^* \quad \forall p \in [0,1], \pi_p(a_1 | s_0) = p, \pi_p(a_2 | s_0) = 1 - p$$

All  $\pi_p$  are optimal

All bandit problems can be modeled as an MDP, so these are also true for MDPs

# OPTIMAL POLICIES

## DEFINITIONS

Set of all policies  $\Pi$ , set of all optimal policies  $\Pi_*$

Definition #1

$\pi \geq \pi'$  if  $\forall s, v_\pi(s) \geq v_{\pi'}(s)$  — at least as good in every state

$\pi \in \Pi_*$  if  $\forall \pi' \in \Pi, \pi \geq \pi'$  — at least as good as any other policy in every state

# OPTIMAL POLICIES

## DEFINITIONS

### Definition #2

$J(\pi) \doteq \mathbb{E}[G_0] = \sum_s d_0(s) v_\pi(s)$  — policy's quality is determined by the start state distribution

$\Pi_* = \arg \max_{\pi} J(\pi)$  — all policies that optimize the value function in the first state

- Only has to be optimal in states that are reachable from the starting states
- The optimal policy can be terrible in states that are not reachable from the start state

# OPTIMAL POLICIES

## DEFINITIONS — EXAMPLE

# OPTIMAL POLICIES

## DEFINITIONS — EXAMPLE

Definition #1

Definition #2

# OPTIMAL POLICIES

## DEFINITIONS

We will use definition #1 in the first part of this course

We will use definition #2 when we switch to function approximation

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

Compute  $q_\pi$ ,  $v_\pi$  for  $s_0, s_1, s_2$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

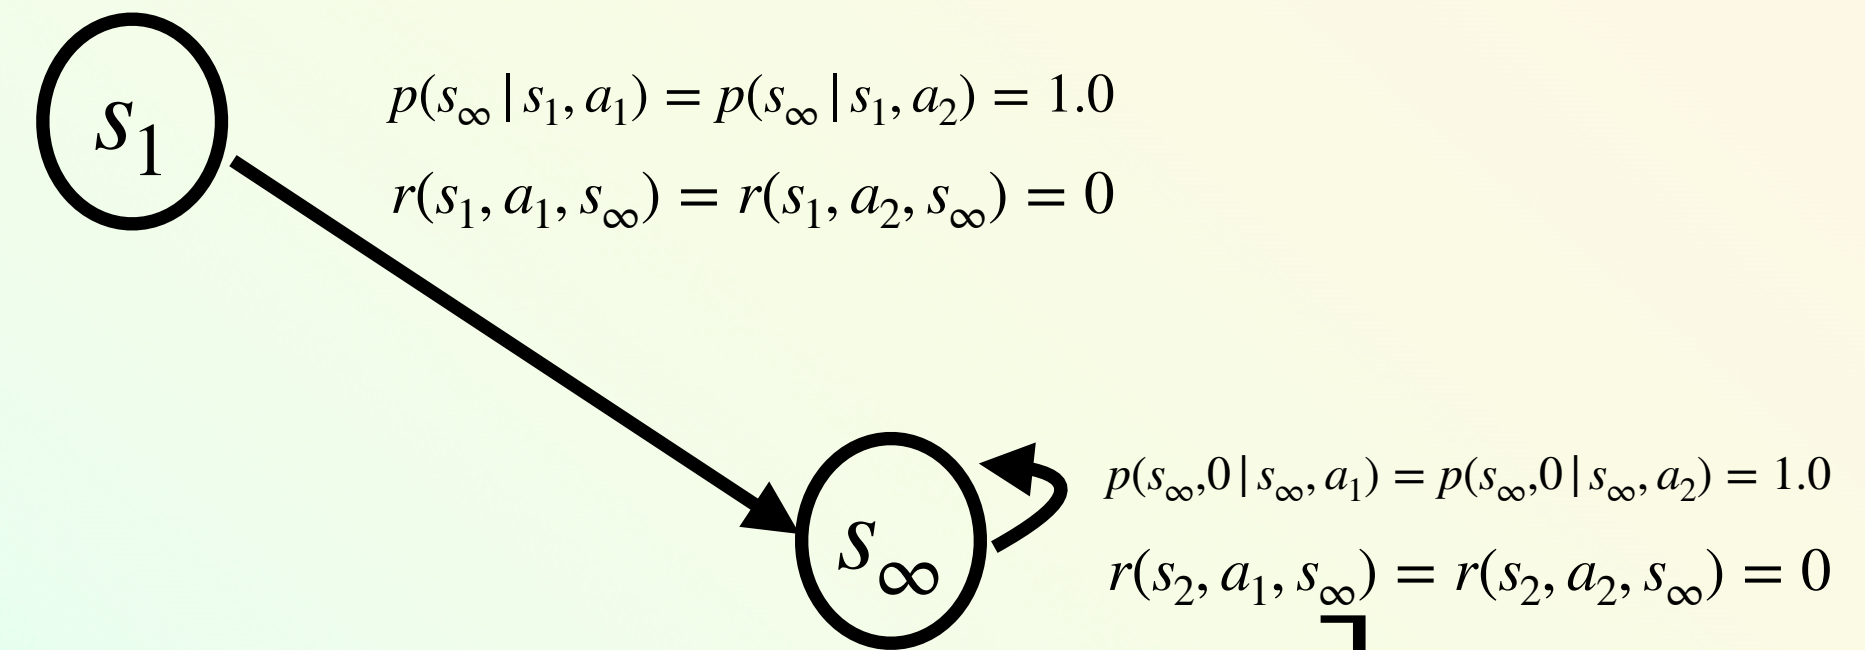

$$q_{\pi}(s_1, a_1) = ?$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

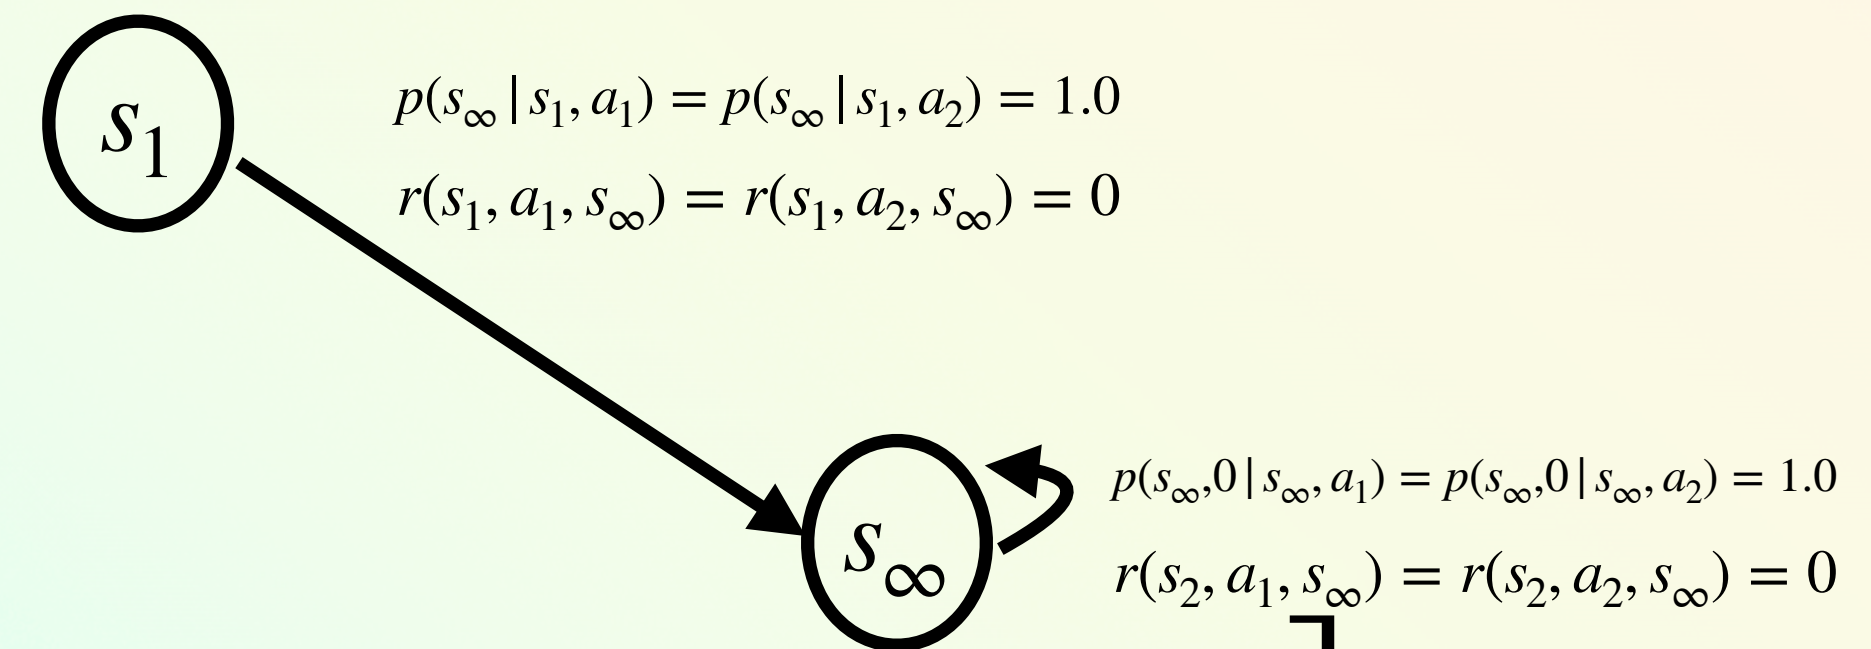

$$\begin{aligned} q_\pi(s_1, a_1) &= \mathbb{E}[G_t | S_t = s_2, A_t = a_1] \\ &= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + \mathbb{E} \left[ \sum_{k=1}^{\infty} \gamma^k R_{t+1+k} | S_t = s_1, A_t = a_1 \right] \end{aligned}$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$q_\pi(s_1, a_1) = \mathbb{E}[G_t | S_t = s_1, A_t = a_1]$$

$$= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + \mathbb{E} \left[ \sum_{k=1}^{\infty} \gamma^k R_{t+1+k} | S_t = s_1, A_t = a_1 \right]$$

$$= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + \mathbb{E} \left[ \sum_{k=1}^{\infty} \gamma^k R_{t+1+k} | S_{t+1} = s_\infty \right]$$

$$= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + 0$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$q_\pi(s_1, a_1) = \mathbb{E}[G_t | S_t = s_2, A_t = a_1]$$

$$= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + \mathbb{E} \left[ \sum_{k=1}^{\infty} \gamma^k R_{t+1+k} | S_t = s_1, A_t = a_1 \right]$$

$$= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + \mathbb{E} \left[ \sum_{k=1}^{\infty} \gamma^k R_{t+1+k} | S_{t+1} = s_\infty \right]$$

$$= \mathbb{E}[R_{t+1} | S_t = s, A_t = a_1] + 0$$

$$= r(s_1, a_1, s_\infty) = 0$$

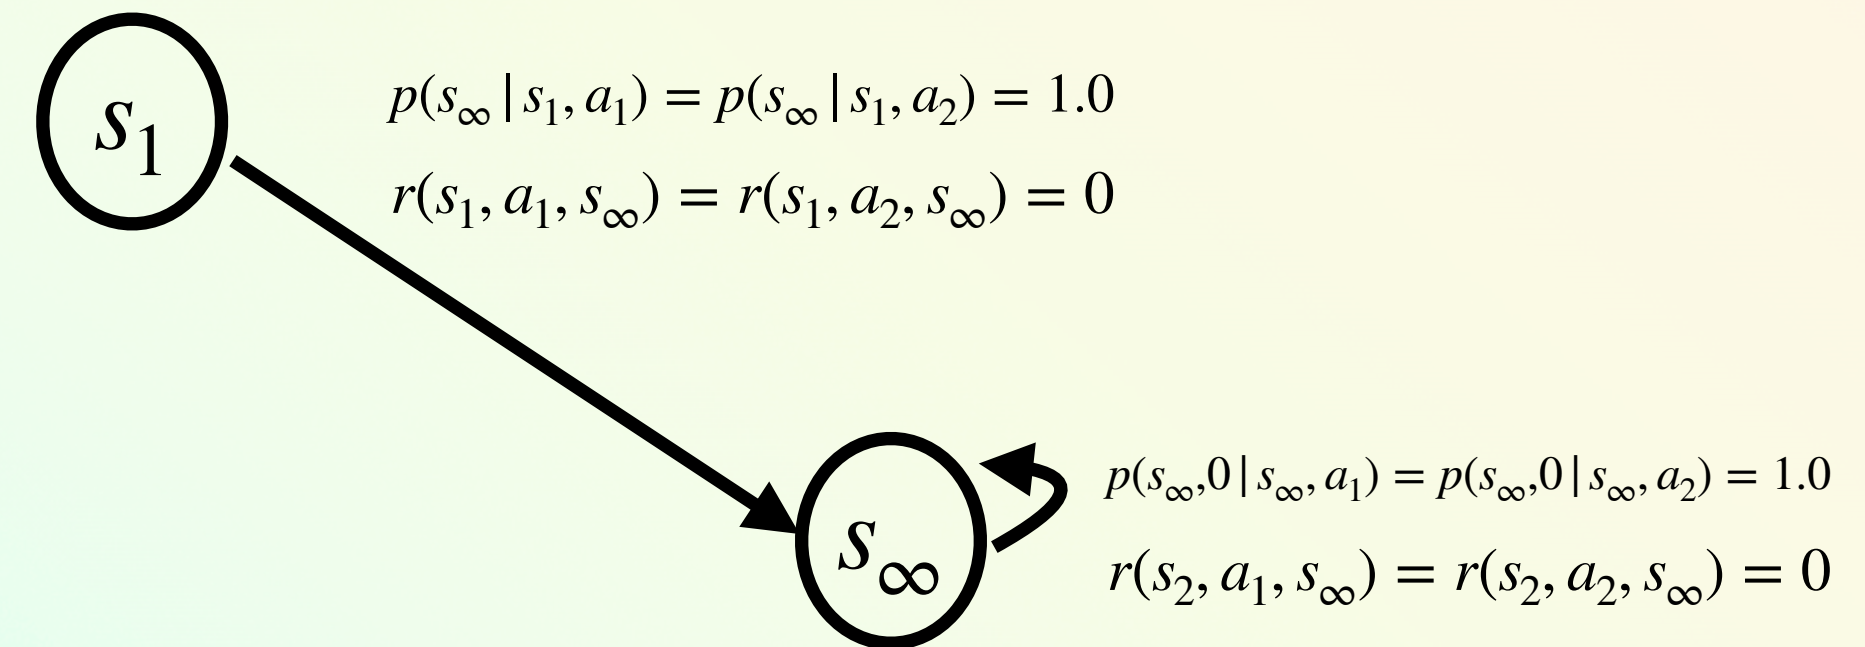

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$q_{\pi}(s_1, a_1) = q_{\pi}(s_1, a_2) = 0$$

$$v_{\pi}(s_1) = 0 \quad \text{for all } \pi$$

All policies are optimal in  $s_1$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$q_{\pi}(s_2, a_2) = r(s_2, a_2, s_{\infty}) = 5$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$q_{\pi}(s_2, a_1) = ?$$

$$\pi(s_2) = a_1$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$q_{\pi}(s_2, a_1) = ?$$

$$\pi(s_2) = a_1$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$\pi(s_2) = a_1$$

Agent gets a reward of 2 every step until the episode ends

$$G_t = \sum_{k=0}^{K-1} \gamma^k 2 = 2 \frac{1 - \gamma^K}{1 - \gamma}$$

$K$  is a random variable for the number of time steps until termination

$$\Pr(K = k) = (0.9)^{(k-1)}(0.1)$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$$\begin{aligned}\mathbb{E}[G_t | S_t = s_2, A_t = a_1] &= \mathbb{E} \left[ 2 \frac{1 - \gamma^K}{1 - \gamma} | S_t = s_2, A_t = a_1 \right] \\ &= \sum_{k=1}^{\infty} \Pr(K = k) 2 \frac{1 - \gamma^k}{1 - \gamma} \\ &= \sum_{k=1}^{\infty} (0.9)^{(k-1)} (0.1) 2 \frac{1 - \gamma^k}{1 - \gamma} \\ &= \frac{2}{1 - 0.9\gamma}\end{aligned}$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

For  $\pi(s_2) = a_1$

$$q_{\pi}(s_2, a_1) = \frac{2}{1 - 0.9\gamma}$$

$$q_{\pi}(s_2, a_2) = 5$$

$$v_{\pi}(s_2) = q_{\pi}(s, a_1)$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

For  $\pi(s_2) = a_2$

$$\begin{aligned} q_{\pi}(s_2, a_1) &= 0.9 (r(s_2, a_1, s_2) + \gamma r(s_2, a_2, s_{\infty})) + 0.1(0) \\ &= 0.9(2 + \gamma 5) \end{aligned}$$

$$q_{\pi}(s_2, a_2) = 5$$

$$v_{\pi}(s_2) = q_{\pi}(s_2, a_2) = 5$$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

$q_{\pi}(s_0, a) = ?$

# COMPUTING VALUES FUNCTIONS

## EXAMPLE

# COMPUTING VALUE FUNCTIONWS

$$q_{\pi}(s_0, a)$$

$$\begin{aligned} q_{\pi}(s_0, a_1) &= \mathbb{E}[G_t | S_t = s_0, A_t = a_1] \\ &= \mathbb{E}[R_{t+1} + \gamma G_{t+1} | S_t = s_0, A_t = a_1] \\ &= \underbrace{\mathbb{E}[R_{t+1} | S_t = s_0, A_t = a_1]}_{=r(s_0, a_1)} + \gamma \mathbb{E}[G_{t+1} | S_t = s_0, A_t = a_1] \end{aligned}$$

# COMPUTING VALUE FUNCTIONWS

$$q_{\pi}(s_0, a)$$

$$\begin{aligned} r(s_0, a_1) &= \mathbb{E}[R_{t+1} \mid S_t = s_0, A_t = a_1] \\ &= \sum_{s'} p(s_0, a_1, s') r(s_0, a_1, s') \\ &= p(s_0, a_1, s_1) r(s_0, a_1, s_1) + p(s_0, a_1, s_2) r(s_0, a_1, s_2) \\ &= 0.7(1) + 0.3(4) = 1.9 \end{aligned}$$

# COMPUTING VALUE FUNCTIONWS

$$q_{\pi}(s_0, a)$$

$$\begin{aligned}\mathbb{E}[G_{t+1} | S_t = s_0, A_t = a_1] &= \sum_{s'} p(s_0, a_1, s') \mathbb{E}[G_{t+1} | S_t = s_0, A_t = a_1, S_{t+1} = s'] \\ &= \sum_{s'} p(s_0, a_1, s') \underbrace{\mathbb{E}[G_{t+1} | S_{t+1} = s']}_{t'=t+1} \\ &= \sum_{s'} p(s_0, a_1, s') \mathbb{E}[G_{t'} | S_{t'} = s'] \\ &= \sum_{s'} p(s_0, a_1, s') v_{\pi}(s') \\ &= p(s_0, a_1, s_1) v_{\pi}(s_1) + p(s_0, a_1, s_2) v_{\pi}(s_2)\end{aligned}$$

# COMPUTING VALUE FUNCTIONWS

$$q_{\pi}(s_0, a)$$

$$\begin{aligned} q_{\pi}(s_0, a_1) &= \mathbb{E}[G_t | S_t = s_0, A_t = a_1] \\ &= \mathbb{E}[R_{t+1} + \gamma G_{t+1} | S_t = s_0, A_t = a_1] \\ &= r(s_0, a_1) + \gamma \sum_{s'} p(s_0, a_1, s') v_{\pi}(s') \end{aligned}$$

This is one version of the Bellman equation. We will finish this example and cover the bellman equation next class.

# NEXT CLASS

## WHAT YOU SHOULD DO

1. Quiz due Friday night: Value Functions and Bellman Equations 1

Monday: Continuation and Bellman Equation
